

Python Operators

Python Operators in general are used to perform operations on values and variables. These are standard symbols used for the purpose of logical and arithmetic operations.

Arithmetic Operators

[Arithmetic operators](#) are used to performing mathematical operations like addition, subtraction, multiplication, and division.

Operator	Description	Syntax
+	Addition: adds two operands	$x + y$
-	Subtraction: subtracts two operands	$x - y$
*	Multiplication: multiplies two operands	$x * y$
/	Division (float): divides the first operand by the second	x / y
//	Division (floor): divides the first operand by the second	$x // y$
%	Modulus: returns the remainder when the first operand is divided by the second	$x \% y$
**	Power: Returns first raised to power second	$x ** y$

Example: Arithmetic operators in Python

- Python3

```
# Examples of Arithmetic Operator
```

```
a = 9
```

```
b = 4
```

```
# Addition of numbers
```

```
add = a + b
```

```
# Subtraction of numbers
```

```
sub = a - b
```

```
# Multiplication of number
```

```
mul = a * b
```

```

# Division(float) of number
div1 = a / b

# Division(floor) of number
div2 = a // b

# Modulo of both number
mod = a % b

# Power
p = a ** b

# print results
print(add)
print(sub)
print(mul)
print(div1)
print(div2)
print(mod)
print(p)

```

Output

```

13
5
36
2.25
2
1
6561

```

Comparison Operators

[Comparison](#) of [Relational operators](#) compares the values. It either returns **True** or **False** according to the condition.

Operator	Description	Syntax
>	Greater than: True if the left operand is greater than the right	$x > y$
<	Less than: True if the left operand is less than the right	$x < y$
==	Equal to: True if both operands are equal	$x == y$

Operator	Description	Syntax
!=	Not equal to – True if operands are not equal	x != y
>=	Greater than or equal to True if the left operand is greater than or equal to the right	x >= y
<=	Less than or equal to True if the left operand is less than or equal to the right	x <= y

Example: Comparison Operators in Python

- Python3

```
# Examples of Relational Operators
```

```
a = 13
```

```
b = 33
```

```
# a > b is False
```

```
print(a > b)
```

```
# a < b is True
```

```
print(a < b)
```

```
# a == b is False
```

```
print(a == b)
```

```
# a != b is True
```

```
print(a != b)
```

```
# a >= b is False
```

```
print(a >= b)
```

```
# a <= b is True
```

```
print(a <= b)
```

Output

```
False
```

```
True
```

```
False
```

```
True
```

```
False
```

```
True
```

Logical Operators

[Logical operators](#) perform **Logical AND**, **Logical OR**, and **Logical NOT** operations. It is used to combine conditional statements.

Operator	Description	Syntax
and	Logical AND: True if both the operands are true	x and y
or	Logical OR: True if either of the operands is true	x or y
not	Logical NOT: True if the operand is false	not x

Example: Logical Operators in Python

- Python3

```
# Examples of Logical Operator
a = True
b = False
```

```
# Print a and b is False
print(a and b)
```

```
# Print a or b is True
print(a or b)
```

```
# Print not a is False
print(not a)
```

Output

False

True

False

Bitwise Operators

[Bitwise operators](#) act on bits and perform the bit-by-bit operations. These are used to operate on binary numbers.

Operator	Description	Syntax
&	Bitwise AND	x & y

Operator	Description	Syntax
	Bitwise OR	x y
~	Bitwise NOT	~x
^	Bitwise XOR	x ^ y
>>	Bitwise right shift	x>>
<<	Bitwise left shift	x<<

Example: Bitwise Operators in Python

- Python3

```
# Examples of Bitwise operators
a = 10
b = 4

# Print bitwise AND operation
print(a & b)

# Print bitwise OR operation
print(a | b)

# Print bitwise NOT operation
print(~a)

# print bitwise XOR operation
print(a ^ b)

# print bitwise right shift operation
print(a >> 2)

# print bitwise left shift operation
print(a << 2)
```

Output

0
14
-11

14

2

40

Assignment Operators

[Assignment operators](#) are used to assigning values to the variables.

Operator	Description	Syntax
=	Assign value of right side of expression to left side operand	$x = y + z$
+=	Add AND: Add right-side operand with left side operand and then assign to left operand	$a += b$ $a = a + b$
-=	Subtract AND: Subtract right operand from left operand and then assign to left operand	$a -= b$ $a = a - b$
*=	Multiply AND: Multiply right operand with left operand and then assign to left operand	$a *= b$ $a = a * b$
/=	Divide AND: Divide left operand with right operand and then assign to left operand	$a /= b$ $a = a / b$
%=	Modulus AND: Takes modulus using left and right operands and assign the result to left operand	$a \% = b$ $a = a \% b$
//=	Divide(floor) AND: Divide left operand with right operand and then assign the value(floor) to left operand	$a //= b$ $a = a // b$
**=	Exponent AND: Calculate exponent(raise power) value using operands and assign value to left operand	$a ** = b$ $a = a ** b$
&=	Performs Bitwise AND on operands and assign value to left operand	$a \& = b$ $a = a \& b$
=	Performs Bitwise OR on operands and assign value to left operand	$a = b$ $a = a b$

Operator	Description	Syntax
<code>^=</code>	Performs Bitwise xOR on operands and assign value to left operand	<code>a^=b</code> <code>a=a^b</code>
<code>>>=</code>	Performs Bitwise right shift on operands and assign value to left operand	<code>a>>=b</code> <code>a=a>>b</code>
<code><<=</code>	Performs Bitwise left shift on operands and assign value to left operand	<code>a <<= b</code> <code>a= a << b</code>

Example: Assignment Operators in Python

- Python3

```
# Examples of Assignment Operators
```

```
a = 10
```

```
# Assign value
```

```
b = a
```

```
print(b)
```

```
# Add and assign value
```

```
b += a
```

```
print(b)
```

```
# Subtract and assign value
```

```
b -= a
```

```
print(b)
```

```
# multiply and assign
```

```
b *= a
```

```
print(b)
```

```
# bitwise lishift operator
```

```
b <<= a
```

```
print(b)
```

Output

```
10
```

```
20
```

```
10
```

100

102400

Identity Operators

is and **is not** are the [identity operators](#) both are used to check if two values are located on the same part of the memory. Two variables that are equal do not imply that they are identical.

is True if the operands are identical

is not True if the operands are not identical

Example: Identity Operator

- Python3

```
a = 10
```

```
b = 20
```

```
c = a
```

```
print(a is not b)
```

```
print(a is c)
```

Output

True

True

Membership Operators

in and **not in** are the membership operators; used to test whether a value or variable is in a sequence.

in True if value is found in the sequence

not in True if value is not found in the sequence

Example: Membership Operator

- Python3

```
# Python program to illustrate
```

```
# not 'in' operator
```

```
x = 24
```

```
y = 20
```

```
list = [10, 20, 30, 40, 50]
```

```
if (x not in list):
```

```
    print("x is NOT present in given list")
```

```
else:
```

```
    print("x is present in given list")
```

```
if (y in list):
```

```
    print("y is present in given list")
```

```
else:  
    print("y is NOT present in given list")
```

Output

x is NOT present in given list

y is present in given list

•

Examples of Operator Associativity

```
# Left-right associativity  
# 100 / 10 * 10 is calculated as  
# (100 / 10) * 10 and not  
# as 100 / (10 * 10)  
print(100 / 10 * 10)
```

```
# Left-right associativity  
# 5 - 2 + 3 is calculated as  
# (5 - 2) + 3 and not  
# as 5 - (2 + 3)  
print(5 - 2 + 3)
```

```
# left-right associativity  
print(5 - (2 + 3))
```

```
# right-left associativity  
# 2 ** 3 ** 2 is calculated as  
# 2 ** (3 ** 2) and not  
# as (2 ** 3) ** 2  
print(2 ** 3 ** 2)
```

Output

100.0

6

0

512
